

Project: TourMate AI

Your AI Travel Companion for Northern Pakistan

1. The Problem

Tourism information about places like **Swat, Kaghan, Naran, Chitral, Hunza, Skardu, and Murree** is scattered across:

- Facebook groups
- TikTok/Instagram
- Google Maps
- Different hotel websites
- YouTube videos
- Local travel agents
- Random WhatsApp groups

Visitors often don't know:

- Is the road open?
 - Is a hotel actually available?
 - Is the location safe to visit?
 - What is the current weather?
 - How much will the trip cost?
 - Which places can be visited together?
 - Is a viral tourist spot actually worth visiting?
 - Where can they find verified local guides?
-

2. Our Solution

TourMate AI combines tourism information into one platform.

Instead of searching 10 different places, a tourist can simply say:

"I have 3 days, Rs. 30,000 budget, and I want to visit Swat with my friends."

The AI creates a complete plan including:

**Transport → Hotels → Places → Food → Activities → Estimated Cost → Road Conditions
→ Weather**

3. Main Concept

4. ☐ AI Trip Planner

This should be one of your **main features**.

User enters:

Destination: Swat
Duration: 4 days
Budget: Rs. 35,000
People: 4
Interests: Nature + Adventure
Transport: Car

AI generates:

Day 1

- Mingora
- Fizagat
- Hotel check-in
- Local food

Day 2

- Malam Jabba
- Adventure activities
- Nearby attractions

Day 3

- Kalam
- Ushu Forest
- Mahodand Lake

Day 4

- Bahrain
- Return

It can automatically adjust the itinerary according to **weather, road conditions, budget, and available time.**

5. 🗺️ Smart Tourism Map

Instead of a normal Google-style map, create a tourism-specific map.

Show:

☐ Tourist attractions

🏠 Hotels

🍽️ Restaurants

⛽ Petrol stations

🏥 Hospitals

☐ 🧑🏻‍🎓 Verified guides

🚗 Road conditions

⚠️ Alerts

Example:

```
KALAM
|
🏞️ Mahodand Lake
|
📶 Road Open
|
🏠 Verified Hotel
|
🍽️ Restaurant
|
⚠️ Road Slow
|
```

6. Live Road Condition System

This can make the project much more useful.

Instead of simply showing:

"Road open"

show:

Kalam Road

☐ **Open**

Traffic: Moderate

Condition: Partially damaged

Weather: Rain expected

Last update: 25 minutes ago

You can allow **local users/drivers to submit reports**.

Example:

"Landslide near Bahrain. Traffic stopped."

The report appears on the map.

7. Multimodal AI Tourism Reporter

This is where you can make the project genuinely **multimodal**.

A user can upload a photo of a road.

AI can analyze the image and identify potential visible issues such as:

- Mud
- Standing water
- Snow coverage

- Visible road damage
- Blockage

Then the user confirms:

Road condition report generated

```
Photo
↓
Vision AI
↓
Road Condition Analysis
↓
Location
↓
Report
↓
Tourism Map
```

Don't claim that image AI can guarantee whether a road is safe; it should be presented as **supporting evidence for reports**.

8. 🎤 Voice-Based Travel Assistant

Instead of typing, tourists can speak.

Example:

"Mujhe Lahore se 3 din ke liye Naran jana hai, budget 40 hazar hai."

AI understands:

- Starting location
- Destination
- Duration
- Budget

Then creates the trip.

This is especially useful for users who prefer **Urdu or Urdu-English voice interaction**.

9. 🏨 Verified Hotels

Hotels can create profiles containing:

- Name
- Location
- Price range
- Rooms
- Photos
- Facilities
- Contact
- Availability
- User reviews

Verification

Instead of allowing completely random listings:

✓ Verified Business

can be shown for businesses that pass your platform's verification process.

You could also show:

Last verified: September 2026

This is much better than simply calling everything "verified" without a process.

10. Verified Local Guides

Local guides can register.

Profile:

Ali Khan

✓ Identity/Business Verified

Location: Kalam

Experience: 5 years

Languages:

Urdu • English • Pashto

Specialties:

 Hiking

 Photography

 Local Tours

Rating: 4.8

Tourists can contact/book them.

11. 💰 AI Trip Budget Calculator

The user enters:

4 people + 4 days + Swat + Rs. 40,000

AI estimates:

Expense Estimated

Transport Rs. 12,000

Hotel Rs. 10,000

Food Rs. 8,000

Activities Rs. 4,000

Other Rs. 3,000

Total Rs. 37,000

Then:

☐ **Within Budget**

12. ☁️ Weather-Aware Planning

This is another important AI feature.

Suppose the user planned:

Mahodand Lake on Day 2

But weather data indicates bad weather.

AI can say:

⚠ Weather conditions may affect this activity. Consider moving the lake visit to Day 3 and visiting a nearby attraction on Day 2.

So the itinerary isn't static.

13. 📍 Smart Travel Alerts

Users can receive alerts for:

- Road closures
- Heavy rain
- Snowfall
- Landslides
- Flooding
- Major traffic
- Destination restrictions

Example:

⚠ Travel Alert

Road conditions near your planned route have changed.
Your itinerary has been updated.

14. 📍 "Nearby" Feature

When tourists reach a destination, they can press:

What's Around Me?

The app shows:

- Hotels
- Restaurants
- Tourist attractions
- Hospitals
- Petrol stations
- ATMs
- Local guides
- Emergency contacts

This makes the app useful **during the trip**, not just while planning.

15. ☐ AI Tourism Chatbot

Instead of a generic chatbot, give it access to your tourism database.

User:

"I'm staying in Kalam. What can I visit tomorrow?"

AI:

"Based on your location, available attractions, weather and road information, here are the available options..."

User:

"I only have Rs. 5,000."

AI changes the recommendations.

16. ★ Reviews With AI

Don't just show thousands of reviews.

AI summarizes them.

Example:

Hotel Reviews

AI Summary

👉 Visitors commonly mention:

- Clean rooms
- Good location
- Helpful staff

⚠ Common complaints:

- Weak Wi-Fi
- Limited parking

This saves tourists from reading 100 reviews.

17. 📷 "Identify This Place"

This could be a fun multimodal feature.

User uploads a picture:

The AI can provide:

- Possible location
- Description
- Nearby attractions
- Best visiting time
- Travel information

Again, phrase it as **AI identification/likely match**, not guaranteed identification.

18. 🏠 Local Business Marketplace

This helps solve the **local business** side of the problem.

Local businesses can list:

- Hotels
- Guides
- Jeep services
- Restaurants
- Camping
- Adventure activities
- Local handicrafts

So the platform benefits both:

Tourists → Better information

Local businesses → More customers

19. Multimodal AI Architecture

This is how you can explain the AI component to judges:

20. What We Should Actually Build

There are **many possible features**, but don't try to build all of them.

For the hackathon, I recommend focusing on these **6**:

★ Core MVP

1. **AI Trip Planner**
2. **Smart Tourism Map**
3. **Road-condition reporting**
4. **Voice-based travel assistant**
5. **Verified hotels/guides**
6. **Weather + road-aware itinerary adjustment**

★ One impressive extra

Upload a road/location photo → AI analyzes it → creates a report → places it on the map.

That gives you a clear **multimodal AI demonstration**.

21. Team of 6

Member	Work
1	Frontend/UI/UX
2	Maps + location
3	Backend + database
4	AI trip planner + chatbot
5	Vision + voice AI
6	APIs + integration + testing

22. Final Demo

Your presentation can tell this story:

Tourist says:
"I have 3 days and Rs. 40,000."

↓

The main idea in one sentence:

TourMate AI is a multimodal AI tourism platform that helps tourists discover, plan, verify, and safely navigate destinations across Pakistan while connecting them with trusted local businesses.

This concept has a useful balance: **AI + maps + real-world problem + local businesses + multimodal interaction**, without requiring any hardware.
